
Smiley, W. McKinley, Cram, J., Margoles, M., Romano, T., Stiller, J.

Hopefully, the methodology and treatment considerations contemporaneously revealed will enhance the diagnostic techniques of physicians associated with patients disabled as a result of trauma. It is legend that the value is directly commensurate with medical diagnosis and aspects of causations. Technological advances designed to provide objectivity in the detection of painful disorders will provide inestimable value in the diagnosis, treatment, and proof of soft-tissue injury. Surely, all trial lawyers, as well as patients/clients, will continue to be complimented by the efforts of doctors devoted to “opening doors which previously have remained closed.”
