(Article in German)<br>Summary: The significance of electromyography measurements in the diagnosis and treatment of craniomandibular dysfunction.<br>Dental diagnosis and thereby, effective preparation for therapy can be differentiated through electromyography, which has long been a standard application in other clinical areas. The causes of multiple pain in patients with cranio-mandibular dysfunction can be pinpointed very accurately by means of resting and functional muscle activity measurements. On the basis of this extremely reliable diagnostic classification, a similarly reliable treatment plan can be laid out. We illustrate the above using actual case histories.<br>Key words: craniomandibular dysfunction, EMG, functional disorders of the cranial joints | Z.f.Physiotherapeuten 55 (2003) 2.                 |

Especially ascending disorders of the muscular system in head and neck cannot be managed only TENS-Therapy of the cranio-mandibular musculature. The electro-ear-acupuncture represents an important adjunctive for eliminating ascending disturbances in order to relax the head, neck and masticatory system prior to bite registration. | ICCMO-Kompodium. 2004. 53-62                                     |

Although the interaction between craniocervical and craniomandibular dysfunctions are well-known, they are not sufficiently taken into consideration in diagnosis and treatment of patients with whiplash-associated syndrome. Because of the problem's complexity and the multifactorial and structural influences, a multi-disciplinary cooperation is essential in the management of those patients. | Manuelle Therapie 2006: 10:13-21                          |
